One realisation of the ensemble configuration under two arms of the acceptance rule

seed 42, N = 40, 6 parcels per species, to MCS 100; commit de8d88e-dirty; julia 1.12.7 on x86_64-conda-linux-gnu

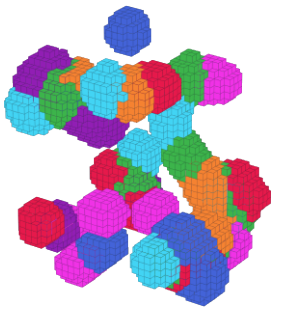

(a) full model, MCS 0, the shared seeding frame

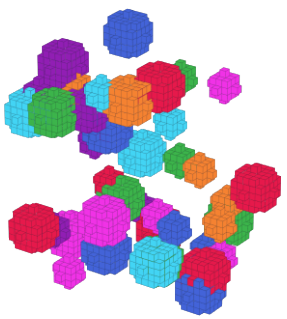

(b) full model, MCS 50

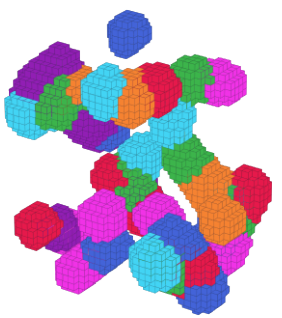

(c) full model, MCS 100

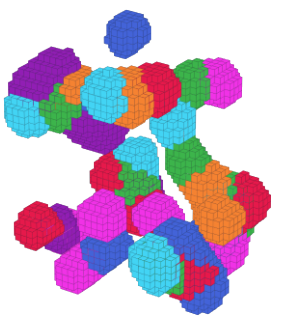

(d) both terms off, MCS 0, the shared seeding frame

(e) both terms off, MCS 50

(f) both terms off, MCS 100

C. neoformans
C. sphaerospermum
A. niger
O. intermedium
D. radiodurans
B. subtilis
S. oneidensis

Bottom row: both radiation-derived vectors zeroed (beta_ion = 0 and alpha_M = 0); the acceptance rule keeps adhesion and volume only.

Every reported number comes from the 256-seed ensemble; this single realisation is what those curves average over.
